A large number of people have shown a keen interest in learning how to build a smart chatbot. To help us gain a better understanding of the process, I'm excited to bring you a special guest post by [Damien Benveniste](#). He is the author of [The AiEdge newsletter](#) and was a Machine Learning Tech Lead at Meta. He holds a PhD from The Johns Hopkins University.

Below, he shares how to build a smart chatbot in 10 minutes with LangChain.

Subscribe to Damien's [The AiEdge newsletter](#) for more. You can also follow him on [LinkedIn](#) and [Twitter](#).

LangChain is an incredible tool for interacting with Large Language Models (LLM.) In this deep dive, I'll show you how to use databases, tools and memory to build a smart chatbot. At the end, I show how to ask ChatGPT for investment advice. This article covers:

- What is LangChain?
- Indexing and searching new data
 - Let's get some data
 - Pinecone: A vector database
 - Storing the data
 - Retrieving data with ChatGPT

- Giving ChatGPT access to tools
- Providing a conversation memory
- Putting everything together
 - Giving access to Google Search
 - Utilizing the database as a tool
 - Solving a difficult problem: Should I invest in Google today?

What is LangChain?

[LangChain](#) is a package to build applications using LLMs. It is composed of 6 modules:

- **Prompts:** This module allows you to build dynamic prompts using templates. It can adapt to different LLM types depending on the context window size and input variables used as context, such as conversation history, search results, previous answers, and more.
- **Models:** This module provides an abstraction layer to connect to most available third-party LLM APIs. It has API connections to ~40 public LLMs, chat and embedding models.
- **Memory:** This gives the LLMs access to the conversation history.
- **Indexes:** Indexes refer to ways to structure documents so that LLMs can best interact with them. This module contains utility functions for working with

documents and integration to different vector databases.

- **Agents:** Some applications require not just a predetermined chain of calls to LLMs or other tools, but potentially to an unknown chain that depends on the user's input. In these types of chains, there is an agent with access to a suite of tools. Depending on the user's input, the agent can decide which – if any – tool to call.
- **Chains:** Using an LLM in isolation is fine for some simple applications, but many more complex ones require the chaining of LLMs, either with each other, or other experts. LangChain provides a standard interface for Chains, as well as some common implementations of chains for ease of use.

Currently, the API is not well documented and is disorganized, but if you are willing to dig into the [source code](#), it is well worth the effort. I advise you to watch the following introductory video to get more familiar with it:

LangChain Crash Course - Build apps with language models

I now demonstrate how to use LangChain. You can install all the necessary libraries by running the following:

```
pip install pinecone-client langchain openai wikipedia google-api-
```

python-client unstructured tabulate pdf2image

Indexing and searching new data

One difficulty with LLMs is that they only know what they learned during training. So how do we get them to use private data? One way is to make new text data discoverable by the LLM. The typical way to do this is to convert all private data into embeddings stored in a vector database. The process is as follows:

- Chunk the data into small pieces
- Pass that data through an LLM. The resulting final layer of the network can be used as a semantic vector representation of the data
- The data can then be stored in a database of the vector representation used to recover that piece of data

A question which we ask can be converted into an embedding, which is the query. We can then search for pieces of data located close to it in the embedding space and feed relevant documents to the LLM for it to extract an answer from:

Embedding space

Let's get some data

I sourced interesting data for a demonstration and selected the earnings reports of tech giant, Alphabet (Google): <https://abc.xyz/investor/previous/>

Documents to download

Alphabet
Investor Relations

Earnings

We can now load those documents into memory with LangChain, using 2 lines of code:

```
from langchain.document_loaders import DirectoryLoader

loader = DirectoryLoader(
    './Langchain/data/', # my local directory
    glob='**/*.pdf',      # we only get pdfs
    show_progress=True
)
docs = loader.load()
docs
```

[Document(page_content="This transcript is provided for the convenience of investors only, for a full recording please see the Q4 2021 Earnings Call webcast .\n\nAlphabet Q4 2021 Earnings Call February 1, 2022\n\nOperator: Welcome everyone. And thank you for standing by for the Alphabet fourth quarter 2021 earnings conference call. At this time, all participants are in a listen-only mode. After the speaker presentation, there will be a question and answer session. To ask a question during the session, you will need to press star one on your telephone. If you require any further assistance, please press star zero. I would now like to hand the conference over to your speaker today, Jim Friedland, Director of Investor Relations. Please go ahead.\n\nJim Friedland, Director Investor Relations: Thank you. Good after noon, everyone, and welcome to Alphabet's fourth quarter 2021 earnings conference call. With us today are Sundar Pichai, Philipp Schindler and Ruth Porat. Now I'll quickly cover the Safe Harbor. Some of the statements that we make today regarding our business, operations, and financial performance, including the effect of the COVID-19 pandemic on those areas, may be considered forward-looking, and such statements involve a number of risks and uncertainties that could cause actual results to differ materially. For more information, please refer to the risk factors discussed in our Forms 10-K and 10-Q filed with the SEC, including our upcoming Form 10-K filing for the year ended December 31, 2021. During this call, we will present both GAAP and non-GAAP financial measures. A reconciliation of non-GAAP to GAAP measures is included in today's press release, which is distributed and available to the public through our Investor Relations website located at abc.xyz/investor. And now I'll turn the call over to Sundar.\n\nSundar Pichai, CEO Alphabet and Google: Thank you, Jim, and Happy New Year, everyone. The last few months have been challenging for communities everywhere because of Omicron. I'm grateful for the frontline healthcare workers who are helping us through it, and glad to see signs that this wave is receding in many parts of the world. Whether it's helping people find a COVID testing center, learn a new skill, or launch a new business, our mission to organize the world's information and make it universally accessible and useful is as relevant today as it's ever been.\n\nIn 2022, we'll stay focused on evolving our knowledge and information products, including Search, Maps, and YouTube, to be even more helpful. Investments in AI will be key, and we'll continue to make improvements to conversational interfaces like the Assistant. I'll begin by touching on a few highlights from Q4.\n\nOur new AI models are helping to create information experiences that are truly conversational, multimodal, and personal. For example, Multitask Unified Model -- or MUM for short -- has improved searches for vaccine information. And soon, we'll introduce new ways to search with images and words simultaneously. In October, we introduced a new AI architecture, called Pathways. AI models are typically trained to do only one thing. With Pathways a single model can be trained to do thousands, even millions, of things.\n\nFrom MUM to Pathways, to BERT and more, these deep AI investments are helping us lead in search quality. They're also powering innovati

We split them into chunks. Each chunk corresponds to an embedding vector.

```
from langchain.text_splitter import CharacterTextSplitter

text_splitter = CharacterTextSplitter(
    chunk_size=1000,
```

```

    chunk_overlap=0
)
docs_split = text_splitter.split_documents(docs)
docs_split

```

For this reason, we need to convert the data into embeddings and store them in a database.

Pinecone: A vector database

To store the data, I use [Pinecone](#). You can create a free account and automatically get API keys with which to access the database:

Default Project API Keys

Create and manage API Keys in Default Project here

Name	Environment	Value
default	redacted	*****

In the “indexes” tab, click on “create index.” Give it a name and a dimension. I used “1536” for the dimension, as it is the size of the chosen embedding from the OpenAI embedding model. I use the cosine similarity metric to search for similar documents:

Create Index

Index Name * langchain-demo

Dimensions * 1536 Metric * cosine

Pod Type

Starter
Included in the starter plan

S1 Best storage capacity

P1 Faster queries

P2 Lowest latency and highest throughput

Show advanced configuration

Starter Pod UPGRADE
Indexes in Free Tier Environments will be terminated after **7 days** of inactivity

No monthly cost, included in:
Starter Plan Cancel **Create Index**

This will create a vector table:

langchain-demo

Storing the data

Before continuing, make sure to get a OpenAI API key by signing up to the [OpenAI platform](#):

NAME	KEY	CREATED	LAST USED
my test key damien	sk-...H8It	Apr 21, 2023	May 22, 2023

Let's first write down our API keys

```
import os

PINECONE_API_KEY = ... # find at app.pinecone.io
PINECONE_ENV = ...      # next to api key in console
OPENAI_API_KEY = ...    # found at platform.openai.com/account/api-keys

os.environ['OPENAI_API_KEY'] = OPENAI_API_KEY
```

We upload the data to the vector database. The default OpenAI embedding model used in Langchain is 'text-embedding-ada-002' ([OpenAI embedding models](#).) It is used to convert data into embedding vectors

```
import pinecone
from langchain.vectorstores import Pinecone
from langchain.embeddings.openai import OpenAIEMBEDDINGS

# we use the openAI embedding model
embeddings = OpenAIEMBEDDINGS()
pinecone.init(
    api_key=PINECONE_API_KEY,
    environment=PINECONE_ENV
)

doc_db = Pinecone.from_documents(
    docs_split,
    embeddings,
    index_name='langchain-demo'
)
```

We can now search for relevant documents in that database using the cosine similarity metric

```
query = "What were the most important events for Google in 2021?"
search_docs = doc_db.similarity_search(query)
search_docs
```

```
[Document(page_content='In 2020, we announced our largest investment yet to support the future of news with the launch of Google News Showcase\n\n12\nYear in Review\nWhen the world shifted to learning and working from home, Google data centers kept us running, supported users, and, crucially, supported our partners. Whether our partners are developers, advertisers, content creators, or merchants, our performance is only made possible by their success.\n\nFor many of our customers, digital transformation in the cloud became an urgent business priority in 2020. Last year, Google hosted over a trillion minutes of video meetings and over 2.9 billion users chose productivity apps like Gmail, Calendar, Drive, Docs, Sheets, Slides, and Meet every single day.\n\nDevelopers were behind the apps that kept people', metadata={'source': 'Langchain/data/2020_alphabet_annual_report.pdf'}),

```

```
qa = RetrievalQA.from_chain_type(  
    llm=llm,  
    chain_type='stuff',  
    retriever=doc_db.as_retriever(),  
)  
  
query = "What were the earnings in 2022?"  
result = qa.run(query)  
  
result  
  
> 'The total revenues for the full year 2022 were $282,836 million,  
with operating income and operating margin information not provided in  
the given context.'
```

RetrievalQA is actually a wrapper around a specific prompt. The chain type “stuff” will use a prompt, assuming the whole query text fits into the context window. It uses the following prompt template:

Use the following pieces of context to answer the users question.
If you don't know the answer, just say that you don't know, don't try
to make up an answer.

{context}

{question}

Here the context will be populated with the user's question and the results of the retrieved documents found in the database. You can use other chain types: “map_reduce”, “refine”, and “map-rerank” if the text is longer than the context window.
